

CSE 215L: Programming Language II Lab Faculty: Silvia Ahmed, Sec – 4, 5

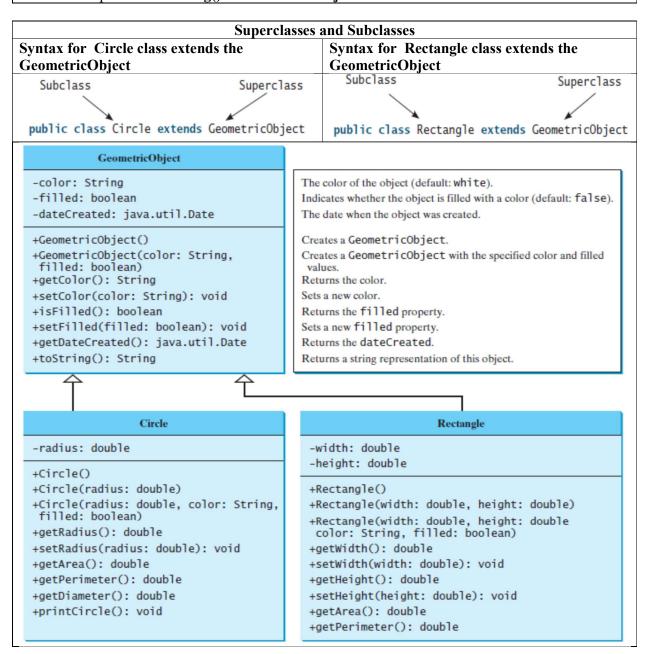

Lab instructor: Marufa Ferdausi

Lab 09 – Fall 2019

Objective:

After today's lab, the students should be able:

- To define a subclass from a superclass through inheritance.
- To invoke the superclass's constructors and methods using the **super** keyword.
- To override instance methods in the subclass.
- To distinguish differences between overriding and overloading.
- To explore the **toString()** method in the **Object** class.

Task - 1

(The Triangle class) Design a class named Triangle that extends GeometricObject. The class contains:

- Three **double** data fields named **side1**, **side2**, and **side3** with default values **1.0** to denote three sides of the triangle.
- A no-arg constructor that creates a default triangle.
- A constructor that creates a triangle with the specified side1, side2, and side3.
- The accessor methods for all three data fields.
- A method named **getArea()** that returns the area of this triangle.
- A method named **getPerimeter()** that returns the perimeter of this triangle.
- A method named **toString()** that returns a string description for the triangle.

The formula to compute the area of a triangle:

$$s = (side1 + side2 + side3)/2;$$

$$area = \sqrt{s(s - side1)(s - side2)(s - side3)}$$

The formula to compute the perimeter of a triangle:

$$perimeter = side1 + side2 + side3;$$

The **toString()** method is implemented as follows:

Draw the UML diagrams for the classes **Triangle** and **GeometricObject** and implement the classes. Write a test program that prompts the user to enter three sides of the triangle, a color, and a Boolean value to indicate whether the triangle is filled. The program should create a **Triangle** object with these sides and set the **color** and **filled** properties using the input. The program should display the area, perimeter, color, and true or false to indicate whether it is filled or not.

Task - 2

(The Person, Student, Employee, Faculty, and Staff classes) Design a class named Person and its two subclasses named Student and Employee.

Make Faculty and Staff subclasses of Employee. A person has a name, address, phone number, and email address. A student has a class status (freshman, sophomore, junior, or senior). Define the status as a constant. An employee has an office, salary, and date hired. Use MyDate class to create an object for date hired. Java API has the GregorianCalendar class in the java.util package, which you can use to obtain the year, month, and day of a date. You may use the GregorianCalendar class to simplify coding.) A faculty member has office hours and a rank. A staff member has a title. Override the toString method in each class to display the class name and the person's name.

Draw the UML diagram for the classes and implement them. Write a test program that creates a **Person**, **Student**, **Employee**, **Faculty**, and **Staff**, and invokes their **toString()** methods.
